IN THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application.

- 1. (Currently Amended) A fabrication system comprising:
- a load chamber;

the substrate;

- a transport chamber connected with said load chamber;
- a plurality of film formation chambers connected with said transport chamber; and an installation chamber connected with each of said film formation chambers;

wherein each of said plurality of film formation chambers comprises:

an aligner for allowing positions of a mask and a substrate to be in registry with each other;

a-substrate-holder a frame having a metal plate which is perpendicular to

- a plurality of evaporation source holders; and
- a moving mechanism for moving said evaporation source holders;

wherein each of said evaporation source holders have containers, said containers being arranged in a longitudinal direction of each of said evaporation source holders, in each of said containers an evaporation material is contained and a heater <u>for heating</u> said containers;

wherein said installation chamber comprises:

- a heater for heating said containers previously; and
- a transport for transporting said containers into said evaporation source holders in said film formation chamber;

wherein each of said plurality of film formation chambers <u>is</u> connected with a first vacuum exhaust treatment chamber for allowing an inside of each of said film formation chambers to be in a vacuum state; and

wherein said installation chamber <u>is</u> connected with a second vacuum exhaust treatment chamber for allowing an inside of said installation chamber to be in a vacuum state.

- 2. (Currently Amended) The vapor deposition system according to claim 1, wherein said substrate holding device frame overlapped a terminal region, a cut region, or an end portion of the substrate with a mask being sandwiched therebetween.
- 3. (Currently Amended) The fabrication system according to claim 1, wherein said substrate holding device frame and said mask are bonded or welded with each other.
- 4. (Previously Presented) The fabrication system according to claim 1, wherein said moving mechanism for moving said evaporation source holders has a mechanism moving said evaporation source holders in an X-axis direction at a given pitch and, further, a Y-axis direction at another given pitch.
- 5. (Original) The fabrication system according to claim 1, wherein said containers are arranged at equal intervals in each of the evaporation source holder.
- 6. (Original) The fabrication system according to claim 1, wherein the evaporation sources holders is rectangular.

- 19. (Currently Amended) A fabrication system comprising:
- a load chamber;
- a transport chamber connected with said load chamber;
- a plurality of film formation chambers connected with said transport chamber; and an installation chamber connected with each of said film formation chambers;

wherein each of said plurality of film formation chambers comprises:

- a CCD camera and a stopper for allowing positions of a mask and a substrate to be in registry with each other;
 - a frame having a metal plate which is perpendicular to the substrate;
 - a plurality of evaporation source holders; and
 - a stage for moving said evaporation source holders;

wherein said each of evaporation source holders have containers, said containers being arranged in a longitudinal direction of each of said evaporation source holders, in each of said containers an evaporation material is contained; and a heater for heating said containers;

wherein said installation <u>chamber</u> comprises:

- a heater for heating said containers previously; and
- a transporting robot for transporting said containers into said evaporation source holders in said film formation chamber;

wherein each of said plurality of film formation chambers is connected with a first vacuum exhaust treatment chamber for allowing an inside of each of said film formation chambers to be in a vacuum state; and

wherein said installation chamber <u>is</u> connected with a second vacuum exhaust treatment chamber for allowing an inside of said installation chamber to be in a vacuum state.

- 20. (Original) The vapor deposition system according to claim 19, wherein said frame overlapped a terminal region, a cut region, or an end portion of the substrate with a mask being sandwiched therebetween.
- 21. (Original) The fabrication system according to claim 19, wherein said frame and said mask are bonded or welded with each other.
- 22. (Original) The fabrication system according to claim 19, wherein said stage has a mechanism moving said evaporation source holders in an X-axis direction at a given pitch and, further, a Y-axis direction at another given pitch.
- 23. (Original) The fabrication system according to claim 19, wherein said containers are arranged at equal intervals in each of said evaporation source holders.
- 24. (Currently Amended) The fabrication system according to claim 19, wherein the rectangular evaporation source holders are rectangular.

25-28. (Canceled)

29. (Previously Presented) The fabrication system according to claim 1, wherein said aligner has at least a CCD camera.

30-33. (Canceled)

- 34. (New) The vapor deposition system according to claim 1, wherein said frame is provided between said source holder and said mask.
- 35. (New) The vapor deposition system according to claim 19, wherein said frame is provided between said source holder and said mask.
- 36. (New) The vapor deposition system according to claim 1, wherein said source holder passes under said frame and said mask.
- 37. (New) The vapor deposition system according to claim 19, wherein said source holder passes under said frame and said mask.
